

•**WANTED**•

FOR CAUSING SERIOUS DAMAGE TO OUR
TREES

**SPOTTED
LANTERNFLY**

Lanternfly Q&A

Q: Why isnt the laternfly an issue in Asia?

A: The laternfly is native in Asia. So over in Asia it has natural predators to keep the laternfly population at a steady rate. Whereas in the US it doesnt have natural predators.

Q: what do they affect?

A: Lanternflies causes damage to trees whichw oozing sap, leaf curling, and dieback. When feeding they leave a substance called honeydew and when turned into mold they affect plants and not humans.

Lanternfly Q&A

Q: Are spotted lanternflies dangerous to people and animals?

A: The spotted lanternfly is not known to bite harm, sting, or attack pets. They are poisonous when digested by humans or pets. They are only known to feed on the sap from the trees.

Q: Why are they spreading so fast?

Lanternflies lay eggs on every surface.
